**Janus tyrosine kinase 3 inhibition for the prevention of transplant rejection**  
18 Dec 03

[comment on this feature](#)

[send this to a friend](#)

### Summary

Transplantation immunotherapy commonly involves the use of azathioprine often combined with low doses of cyclosporine. Increased susceptibility to infection and severe toxicity represent serious adverse effects and a newer molecular target being investigated for the prevention of transplant rejection is **Janus tyrosine kinase 3** (Jak3). Jak3 is this month's "Target of the Month" from LeadDiscovery's and here they describe Pfizer's efforts to optimize inhibitors of this **kinase**

The global market for immunosuppressant therapy is in excess of 4 billion USD per year. This therapeutic class is used for the treatment of both autoimmune diseases ([see](#) our recent analysis of rheumatoid arthritis therapeutics) and for the prevention of organ rejection in transplantation.

Since the first successful kidney transplantation more than 40 years ago, the treatment of end-stage organ failure has dramatically improved. Many organs are now transplanted, the most common of which include (procedures performed in the US in 2001) the kidney (14,000), heart (2,000), **liver** (5,000) and lung (1,000). Despite these figures transplantation is still somewhat limited, mainly because of rejection which can destroy the tissue soon after transplantation or over a more prolonged time frame. Limitations in the availability of human donor organs also continue to be important.

Host vs graft reaction is the principal mechanism of acute rejection and causes graft destruction days to months after transplantation. This reaction is characterized histologically by mononuclear cellular infiltration of the allograft, with varying degrees of hemorrhage and edema. After resolution of acute rejection, the allograft commonly survives for prolonged periods, even though immunosuppressive drug dosages are reduced to very low levels.

Chronic rejection often progresses insidiously despite increased immunosuppressive therapy. It is thought to be due, in large part, to antibody-mediated damage. The pathologic picture differs from that of acute rejection. The arterial endothelium is primarily involved, with extensive proliferation that may gradually occlude the vessel lumen, resulting in ischemia and fibrosis of the graft.

Immunosuppressants are used to control rejection and are primarily responsible for the success of transplantation. Immunotherapy commonly involves the use of azathioprine beginning at the time of transplantation often combined with low doses of cyclosporine. However, immunosuppressants suppress all immunologic reactions, thus making overwhelming infection the leading cause of death in transplant recipients. In addition immunosuppressants are associated with severe toxicity.

The most significant complications of drugs used for transplant patients include nephrotoxicity, neurotoxicity, new-onset post-transplant diabetes mellitus, hyperlipidemia, and hypertension. These side effects occur in part because the molecular targets of currently used immunosuppressants are ubiquitously expressed. A molecular target recently receiving interest is the cytoplasmic localized **Janus tyrosine kinase 3** (Jak3) which is activated by multiple cytokines, including IL-2, IL-4, IL-7, IL-9, IL-15, and IL-21 through engagement of the IL-2R common gamma-chain. JAK3 is primarily expressed in T and B cells and plays a critical role in T cell development and function. Inhibition of this enzyme therefore represents a selective target for new generation immunosuppressants.

In their recent article Changelian et al describe how the screening of Pfizer's chemical library for inhibitors of JAK3 **kinase** activity provided the lead compound, CP-352,664. Extensive chemical modification led to the development of CP-690,550. Although CP-690,550 demonstrated low nanomolar potency for JAK3 inhibition, it was 20- to 100-fold less potent for JAK2 and JAK1 and failed to inhibit a large panel of other **kinase**. JAK2 mediates signaling via many hematopoietic cytokines, and this selectivity is expected to confer less anemia, thrombocytopenia, and leukopenia as compared to less selective molecules.

Cell-based assays demonstrated that CP-690,550 inhibited JAK3 mediated IL-2-induced T cell proliferation with 30-fold greater potency than its effects on JAK2-mediated events. *In vivo* efficacy of CP-690,550 was then determined in a murine model of heterotopic heart transplantation. All animals treated with vehicle alone rejected their allografts within 12 days. In contrast, dosing with CP-690,550 resulted in a dose-dependent increase in survival of transplanted hearts. This effect was extended past the drug administration period such that treatment for 28 days resulted in animals surviving for a median of greater than 60 days.

A second non-human primate model of kidney transplantation was then used to confirm the efficacy of CP-690,550. Vehicle control animals rapidly rejected transplanted kidney. CP-690,550 treatment extended graft survival by ten-fold and increased survival even more effectively than clinically relevant doses of the reference compound cyclosporin A. Dose-limiting side effects associated with current anti-rejection were not seen although anemia was observed at high doses.

This study therefore supports the further development of CP-690,550 and other JAK3 inhibitors. Groups interested in this field should be aware of the **Kinase Enterprise Library**

## Evaluation of some Mannich bases of cycloalkanones and related compounds for cytotoxic activity

Received 20 August 1992; accepted 15 December 1992. Available online 20 May 2004.

### Abstract

A number of Mannich bases of cycloalkanones and related quaternary ammonium compounds were prepared for cytotoxic evaluation in order to examine the theory that sequential release of alkylating agents produces increased bioactivity compared to related compounds containing only 1 potential alkylating site. Many of the compounds had significant activity against murine L1210 cells and various human tumours. Some correlations between structure and activity were noted but the biological data did not support the view that potential sequential liberation of cytotoxic species produced compounds with increased potency. The formation of various oximes and oxime benzoates as candidate prodrugs was achieved but in general these compounds were not cytotoxic at the concentrations utilized. This observation may be due to the fact that the oximes were much more stable in deuterated phosphate buffered saline over a period of 48 h at 37°C than the Mannich bases, as revealed by <sup>1</sup>H-NMR spectroscopy.

**Author Keywords:** Mannich bases; cytotoxic evaluations; prodrugs; <sup>1</sup>H-NMR spectroscopy; structure-activity relationships

COMPLETE THE STN SURVEY - APRIL 27 THROUGH MAY 31

Dear valued STN customer,

In an effort to enhance your experience with STN, we would  
like to better understand what you find useful. Please take  
approximately 5 minutes to complete a web survey.

If you provide us with your name, login ID, and e-mail address, you will be entered in a drawing to win a free iPod(R). Your responses will be kept confidential and will help us make future improvements to STN.

Take survey: <http://www.zoomerang.com/survey.zgi?p=WEB2259HNKWTUW>

Thank you in advance for your participation.

The chemical structure shows a bicyclic system consisting of a decalin core. The decalin is substituted with a ketone group (=O) at the 10-position and two methyl groups (Me) at the 1 and 2 positions. The decalin is fused to a cyclohexene ring, which is also substituted with a methyl group (Me) at the 1-position. The overall structure is a complex polycyclic molecule with a decalin core and a cyclohexene ring.

1 REFERENCES IN FILE CA (1907 TO DATE)  
1 REFERENCES IN FILE CAPLUS (1907 TO DATE)

The chemical structure shows a bicyclic system with a norbornene core. It features a double bond between C2 and C3, and another double bond between C5 and C6. Substituents include a methyl group (Me) at C1, a cyano group (CN) at C2, a carbonyl group (C=O) at C3, a chlorine atom (Cl) at C4, and a methyl group (Me) at C5. A carboxylic acid group is attached to C6, which is also part of a fused cyclohexene ring system.
